A report on observations made over a period of 10-13 months on explantates (Carrel dishes) of muscles and connective tissue of new-born rats. Malignant changes were observed from the 8th month when methylcholanthrene (0.02 mg./100 ml.) in horse serum was added as well as a drop of nucleoprotein obtained from polymorphous rat sarcoma. Inoculation into young rats had positive results. The production of malignancy in tissue cultures was not possible with methylcholanthrene alone.

TITLE: Investigation of a plasma source with the aid of a through passage mass spectrometer

SOURCE: Diagnostika plazmy\* (Plasma diagnostics); sb. statey.  
Moscow, Gosatomizdat, 1963, 163-172

TOPIC TAGS: mass spectrometer, plasma source, plasmoid, plasmoid acceleration, plasma injection, ion separation

ABSTRACT: In view of the lack of information on the internal structure of plasmoids and of a satisfactory description of the mechanism of plasma acceleration in different plasma guns, and in view of the difficulty of interpreting the experimental results on interaction between plasmoids and magnetic fields owing to the lack of this in-

Card 1/3

ACCESSION NR: AT4025306

formation, a method is proposed wherein more detailed microscopic characteristics can be obtained with the aid of through-passage mass spectrometer. This mass spectrometer was used to investigate the mass and energy spectra of plasmoids from a Bostick gun (W. H. Bostick, Phys. Rev. v. 104, 2, 292, 1956). The operation of all the units of the instrument is described in detail in a separate article (Pribory\* i tekhnika eksperimenta, in press). The conditions for optimal mass separation are described. In view of the short transit time employed, there is no need for additional modulation. The apparatus yields mass spectra of ions of given energy, from which the energy spectra of particles having different masses can be plotted. The angular distributions of the ions of different masses and energies were also investigated and it was found that ions with larger velocities form a narrower velocity cone than the slower ions. It is therefore concluded that measurement of the true energy distribution must be accompanied by measurement of the angular distribution of the particles and the number of particles of given energy must be

Card 2/3

ACCESSION NR: AT4025306

0

integrated over all the angles in order to ensure accuracy. The duration of the discharge exerts little influence on the energy spectra. The length of the plasmoid changes as it moves from the source because of the spread in particle velocity, and since the particle velocity decreases with increasing mass, the light ions are concentrated in the frontal part of the plasmoid and the heavy ones in the tail part. This spatial separation of the ions increases with increasing transit length. In the absence of the magnetic field the slow ions are rapidly lost because of the broad velocity cone. There are grounds for assuming that the plasmoids produced by other plasma guns, particularly coaxial, show a similar behavior. Orig. art. has: 9 figures.

Authors : Timofeyevskiy, A. D., Act. Mem. Acad. Med. Sci. SSSR

Title : Malignant tumors

Periodical : Nauka i Zhizn' 21/10, 14-16, Oct 1954

Abstract : The author finds that malignant tumors do not appear in healthy tissue but that some pathological condition has to precede their appearance. He noted a connection between the functioning of the nervous system and the growth of a tumor. It is pointed out that sometimes tumors are produced by chemical irritants or radiation, and an analysis is made of experiments endeavoring to determine whether tumors are caused by viruses. The author finds the latter theory to be inconclusive.

TITLE: On the Problem of Etiology of the Neoplasms (K voprosu ob etiologii opukholey) At the Second All-Union Congress of Oncologists (Na 2-m vsesoyuznom s'yezde onkologov)

PERIODICAL: Priroda, 1958, Nr 5, pp 57-59 (USSR)

ABSTRACT: The Second All-Union Conference of Oncologists in January 1958 dealt with problems of the etiology of tumors, pre-tumor diseases, chemotherapy of tumors, tumors of the bones, and the organization of the anti-cancer fight in the USSR. At the first oncologists' conference 11 years ago, only one paper by Professor L.A. Zil'ber dealt with the virus theory of cancer. This theory became one of the principal themes at the new conference. It was opened by N.N. Petrov, the oldest oncologist of the USSR and Hero of Socialistic Labor. The first paper was delivered by Professor L.A. Zil'ber. It was intitled "On the Virus Nature of the Tumors of Man" and described over 20 tumors and similar processes in animals, the virus origin of which he thinks has been proved. Among them were the sarkoma and leucosis of chickens, the papilloma and fibroma of rabbits, mammary gland cancer and

Card 1/4

26-58-5-10/57

On the Problem of Etiology of the Neoplasms. At the Second All-Union Congress of Oncologists

leucosis of mice. Under the electron microscope, virus-like etiologic agents were found in matter isolated from the tissues of men suffering from leucosis, but the virus origin of most malignant tumors of man have not as yet been demonstrated. A.D. Timofeyevskiy found virus-like globular bodies measuring from 40 to 80 millimicrons in the extracts of diverse tumors of man (cancer of the stomach, the mammary gland, the lung, sarkoma, etc). Immunological reactions showed the specific nature of these bodies. Professor L.F. Larionov criticized the virus theory. He based his doubts on data from medical literature but thought it was possible that some animal tumors were of virus origin, although there is no evidence yet with respect to man. Professor M.A. Morozov, in his paper "Virusoscopic Observations in Malignant Tumors of Man", holds that virus penetration from without is the etiologic factor. I.N. Mayskiy and M. M. Kapichnikov delivered a paper on the immunology of malignant neoplasms. In sarkoma of chickens and several tumors of man, special antigens were found. This agrees with A.D. Timofeyevskiy's discovery of virus-like bodies

Card 2/4

26-58-5-10/57

On the Problem of Etiology of the Neoplasms. At the Second All-Union  
Congress of Oncologists

found in the blood and tissues of people suffering from malignant neoplasms. These bodies could be cultivated in chicken embryos and possess specific antigen properties. It was demonstrated in the State Oncological Institute imeni P.A. Gertsen that in the organism of leucosis patients a non-cellular etiologic agent can be found that has many characteristics of a virus. Most oncologists, however, did not hold true that viruses are the only etiologic factor in malignant tumors. They think that chemical substances and penetrating radiation must be considered of similar etiologic importance. The papers delivered by L.M. Shabad, M.F. Glazunov, A.M. Neyman and others were concerned with the morphological and experimental data characterizing the pre-cancer stage in various tissues and organs of the animal organism. According to L.M. Shabad, every cancer has its special "pre-cancer". The importance of early diagnosis and therapeutic measures was stressed once more. Professor L.F. Larionov pointed out that more than 30 chemical drugs have been successfully administered against malignant tumors in recent years in the USSR. The drugs include the follow-

Card 3/4

Congress of Oncologists

ing groups: hormones (estrogens, androgens, cortisone); antifolic drugs (aminopterin); derivatives of purine and pirimidine (mercaptopurine); chlorethylamines and their derivatives (embichine, nitromine, derganol, dopan sarkolysine); ethylenimines (TET, TEF, E 39, etc); esters of methanesulfoxylic acids (mileran); antibiotics (aktinomycin, sarkomycin), etc. In some cases, such as lymphogranulomatosis, metastases of cancer of the mammal gland, seminoma, etc; long-term healing was achieved by aid of these drugs. While they are useful in cases of lymphogranulomatosis and leucoses, there is almost no way they can be applied in the more important and frequent cases of malignant tumors of the stomach, alimentary tract, lungs, etc. Although 23 papers dealt with the results of new experimental research, new methods of a combined chemotherapy, radiation treatment and surgical measures were recommended.

TITLE: Lithium acetylenides

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 9, 1965, 1607-1613

TOPIC TAGS: organolithium compound, acetylene, benzene, hexane, ether, lithium

ABSTRACT: The authors synthesized crystalline lithium acetylenides in benzene, hexane, and ether in the range of 0 to -50°C, using acetylene alkylacetylenes, and solutions of ethyllithium, n-butyllithium, n-amyllithium, phenyllithium, and p-tollyllithium. The products were analyzed for lithium, and their IR spectra were taken. In some cases, the compounds obtained were decomposed with heavy water, and the deuterated products were studied. It was thus shown that when acetylene reacts with solutions of organolithium compounds, lithium acetylide is formed. When acetylene reacts with aliphatic organolithium compounds in hexane at 0 - 25°C, crystalline lithium acetylide is formed in 75 - 80% yield; when alkylacetylenes react with these compounds at -50°C, lithium alkylacetyl-

4

lenides are formed in 75 - 90% yield. To refine the positions of the main bands in the IR spectra, isotope-substituted lithium acetylenides were synthesized by using lithium-6 and deuterium, and the IR spectra of the products were recorded. Lithium acetylide is stable on standing, apparently because stable complexes are formed between its molecules.

Rapid method for the determination of elementary sulfur by difference. K. M. Timofeyuk. Zarodskaya Lab. B, 218-10 (1939); Chem. Zentr 1940, II, 1906.—The app. used is a 25-cc. pipe which has been cut across near the top of the bulb so as to give a vessel with an outlet tube at the bottom. The lower portion is filled with a layer of hygroscopic cotton wool and the app. is weighed. About 3 g. of the substance is then placed on the cotton wool and the top of the app. is then closed with a stopper through which the tube of a separatory funnel passes. The rate of flow of CS<sub>2</sub> from the separatory funnel can thus be regulated by means of its stopcock. About 50 cc. is sufficient to remove all the free S from the sample. M. G. M.

Formaldehyde method of determining ammoniacal nitrogen in fertilizer mixtures and ammonium superphosphates K. M. Pumolevuk, Zavodskost' Lek. R. 101-2 (1950) - The method involves the successful separ. of  $\text{NH}_4^+$ . Dissolve the  $\text{NH}_4$  salts of a 10 g. wet ground fertilizer mixt. by shaking in a 500 ml. flask, add 2.5 g.  $\text{CaCl}_2$  and neutralize the contents to a bright coloration with 20% NaOH in the presence of phenolphthalein. Remove excess alk. and sol. phosphates by adding 7 ml. of 10%  $\text{FeCl}_3$  soln. Dil. the soln. to 500 ml. and filter. Acidify a portion of the filtrate to methyl red, then neutralize to yellow coloration, add neutral formalin and titrate the soln. with NaOH in the presence of phenolphthalein. In this method of separ. the soln. contained tung.  $\text{P}_2\text{O}_5$ , which did not interfere with the analysis. The accuracy of the method is good. B. Z. Kamach

PICKLING OF IRON WITH ORGANIC ACIDS IN PRESENCE OF REGULATORS. L. V. Stepanov and A. A. Timokhin. Vestn. Metalloprov. 14, No. 1, 102-11; No. 2, 61-75 (1934); Chimie et industrie 32, 833-4.—The action of the regulators that were studied is based on the fact that the substances formed by the hydrolytic decompn. of proteins and contg. the CO<sub>2</sub>H, OH, NH<sub>2</sub> and S radicals, are surface-active and are adsorbed at the metal-electrolyte interface. The initial amt. of the active substance decreases considerably the surface tension of the soln. and the adsorption increases proportionally with the concn. until satn. of the adsorbing layer with the active molt. The adsorbing layers have the power of accelerating the rate of chem. reactions when the polar molts. of the surface-active substance react with one of the constituents of the system. On the other hand, if the active substance is chemically inert, by adsorption it forms a thin film that retards or prevents the reaction. In the case

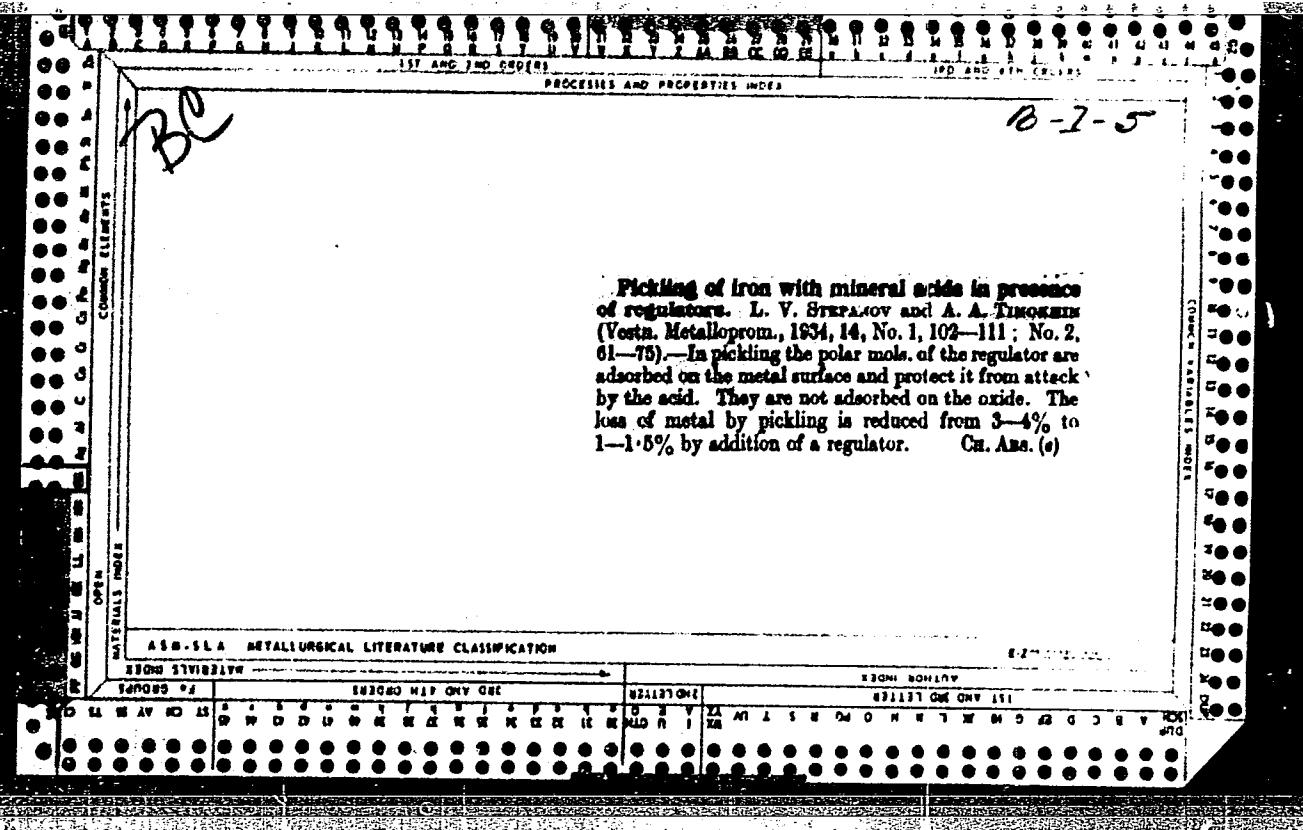

of the pickling of metals, the polar molts., which are adsorbed at the surface of the metal, are but slightly adsorbed at the surface of the oxide covering the metal and exert little protective action on the oxide, whereas the film formed on the metal prevents its attack by the acid. Regulators decrease considerably the quantity of gas evolved during pickling, which constitutes a by no means negligible technological advantage, while at the same time improving the sanitary conditions of the operation. Moreover, the use of regulators permits of increasing the concn. of acid used for pickling and consequently the rate of the reaction. The loss of metal by pickling is generally about 3-4%; this is reduced to about 1-1.5% by adding a regulator.

A. Papineau-Couture
